

Mikhail Makarevich

Address: Moldegata 5, 0445 OSLO

Mobile: 90574726

Date of birth: 03.01.2003

Key Qualifications

- Bachelor's degree student in programming and system architecture with a focus on holistic and secure software development, from requirements analysis and architecture to production deployment and operations, with ambition to become a software engineer.
- Experience with developing production-ready automated solutions in Python used by real users.
- Solid technical expertise in Python and Java, as well as web development and backend integrations
- Practical experience with API integrations, databases and version control through own projects and collaborations
- Conscious and responsible use of AI in development work, including AI-API integration and basic prompt engineering

Education

08.2024 – 05.2027

Computer Science: Programming and System Architecture (Bachelor)– Universitetet i Oslo - UiO

08.2023 – 05.2024

Folk high school– Stavanger Urban Folkehøyskole (StUF)

At school, my program was programming and development, which included the W3Schools web development bootcamp as part of the curriculum. In addition, we had an offline teacher who provided additional insight and support when clarification was needed.

08.2021 – 05.2023

IB school– Kirkenes videregående skole

In high school, I enrolled in the International Baccalaureate (IB) program, which made my integration as a foreign student smoother and allowed me to complete my studies in two years instead of the usual three in Norway.

Work experience

02.2026 – 06.2026

"Vær smart" App - IN2000 Software Engineering Group Project, UiO

Developed an Android trip-planning application in a team of six using Kotlin, Jetpack Compose, MVVM, REST APIs, and agile development practices. Led the LLM integration, enabling AI-generated travel recommendations for clothing, equipment, and editable packing checklists. I also took ownership of the settings screen, refactored code, resolved code-quality issues, and actively contributed to sprint planning, reviews, testing, and team discussions. The project received an A grade.

03.2026 – 03.2026

Hackathon "Build an App in a Weekend", KPMG and ServiceNow

KPMG x ServiceNow Hackathon - Winning Team (1st Place)

Developed an AI-driven onboarding automation solution for Orkla IT using the ServiceNow platform. Designed and implemented a complete system including two AI agents in a workflow, a manager portal, a live progress dashboard, and a structured data model. The solution combined process automation with a clear user focus, with the goal of streamlining onboarding without reducing human follow-up.

12.2025 – 01.2026

Development of an AI-based Telegram bot, Pet project

Telegram bot for automatic summarization of public channels with support for time-based summaries (e.g. last 6 hours / 1–2 days), AI-API integration, and basic prompt engineering.

08.2025 – 09.2025	Personal website , Pet project Developed personal website for presentation of projects and expertise, built with HTML, CSS and JavaScript. Link: https://mikhail4ch.github.io/portfolio-website/#home
06.2025 – 08.2025	Development of Discord and Telegram bots, Pet project Developed and deployed several Discord and Telegram bots in Python, used by real users in public environments, including bots for real-time data, yield calculations, and monitoring liquidity pools on the Eclipse blockchain
06.2024 – 10.2024	Automation projects, Pet project Developed Python-based automation solutions against blockchain APIs, including scripts for automated crypto transactions (swaps) on Taiko and Lisk L2 solutions, which provided both practical API experience and measurable results.
03.2024 – 04.2024	Group project , W3Schools bootcamp Participated in the development of a Weather application in a group responsible for login/registration, database design, and secure storage of user credentials (hashing and access control).

Roles

12.2024 – 07.2025	Contributor Contributor to the Eclipse project (L2 blockchain, SVM) - served as a content producer and technical resource, with explanatory posts about Eclipse's technology stack and market relevance, as well as practical user support in Discord (wallet setup, network usage). Contributions led to the assignment of an OG role and project tokens, as well as public recognition from the project team in the official Discord channel.
06.2024 – 11.2025	Node runner Operated nodes in Web3/AI projects (including Privasea AI) in a VPS environment and contributed to AI and blockchain infrastructure through stable node operation, troubleshooting, and guiding other participants in setup and problem solving.
11.2022 – d.d.	Beta-tester Active participant in testing new solutions within L2 networks and AI infrastructure (including Arbitrum, Optimism, Linea and io.net), with a focus on functionality, stability and user experience. Contributions were recognized through token-based incentives and mentions from the project teams in official channels.

Courses

04.2024	certificate_of_completion_web_development_bootcamp The bootcamp program covered front-end design, back-end development, and database management.
---------	---

IT tools

- Programming languages: Python, Java, Kotlin and Bash.
- Containers and environments: Docker for isolated test and development environments, Linux/Ubuntu/VPS.
- Web and backend: HTML, CSS, JavaScript, Node.js, React, REST API integrations.

- AI tools: AI API integration, prompt engineering and AI agents development.
- Platforms: ServiceNow (AI-based development through hackathon)
- Databases: PostgreSQL, SQL.
- Version control: Git and GitHub.
- Analysis and security: Basic use of IDA for static analysis and reverse engineering.
- Cryptography and password management: Experience with hashing, secure storage of credentials and password testing with John the Ripper in controlled environments.
